

Blood Profile Information

Test Description

Test Name	Description	Cost
PHA Biometrics Cholestech (Finger stick)	Measures total lipids (total cholesterol, HDL, LDL, Chol/HDL ratio and triglycerides) plus glucose. Immediate results available.	\$22.00
Chemistry Profile (Venipuncture)	The profile includes 25 results evaluating the function of the body's water and salt balance, heart, kidney, liver, nerve, muscle, bones, and metabolism. The tests may identify problems with general health, diet, fluid intake, medication, disease, and disorders.	\$22.00
Thyroid Profile – TSH (Thyroid Stimulating Hormone) and FT4 (Free Thyroxine)	Regulates the production and function of thyroid hormones.	\$25.00
PSA (Prostate Specific Antigen)	Assesses the health of the prostate gland.	\$20.00
Hgb A1C (Hemoglobin A1C)	Evaluates long-term control of blood glucose concentrations in diabetics. Not considered a substitute for daily glucose monitoring.	\$20.00
CBC (Complete Blood Count)	Combined, these tests assess the body's white and red blood cell health. The tests indicate anemia, blood loss, hydration, and blood diseases. The body's response to infections, allergic reactions, and disease are evaluated. White blood cells are part of the body's immune system. Red blood cells carry oxygen throughout the body.	\$12.00

Vascular Screenings*

The total cost is **\$95.00** for all four vascular screenings.

Test Name	Description
Carotid Artery Ultrasound	Visualizes fatty buildup (plaque) and blockages inside the carotid arteries. The carotid arteries are two large arteries along each side of the neck that supply blood to the brain. 75% of strokes are associated with blockages in these vessels.
Abdominal Aortic Aneurysm Screen	Visualizes the largest artery in the body, the aorta. The abdominal aorta lies midline near the belly button. A weakened vessel wall (aneurysm) in the aorta can lead to rupture and be fatal.
Peripheral Vascular Disease Screening	Checks for blockages in the arteries of the legs, also known as peripheral artery disease (PAD). Poor blood flow can result in pain in the legs. Abnormal results may also indicate an increased risk for heart attack and stroke.
EKG	Provides important information about the health of the heart. An EKG shows the heart rate and rhythm, evidence of impaired flow or damage and strength of the heart.

***Stroke Detection Plus** will be in the Hoover Building on Thursday, **August 5** and in the Lucas Building on Tuesday, **August 10** from 8:00 – 4:30. These screenings are being conducted in conjunction with the PHA health screenings. The phone number to schedule an appointment with Stroke Detection Plus is 1-877-732-8258.
